

## **Loudspeaker Cable – compact 6 L and M**

By its conductor architecture the compact 6 offers two wiring options:

**L** = Low Impedance, **M** = Mid Impedance:

### **compact 6 M:**

**For compact 6 M use the three red conductors for the positive pole, and the three white conductors for the negative pole.**

This results in a mid impedance.

### **compact 6 L:**

**If you want to create a compact 6 L, take the middle conductor of the red ones and interchange it with the middle white conductor. Please check the proper connection twice.**

In many cases the „M“ variant sounds more spacious and with a sharper image, especially in the depth of the soundstage (compared to the „L“ variant). The vocal range is more reserved. That's why the compact 6 M is considered as „more audiophile“ by many people.
